MXCHIP®

Abstract

- **Input voltage：3.0V~3.6V**

- **Processor：Dual-core CPU RTL8720DF**
  - Performance core KM4： Cortex-M33 with main frequency up to 200MHz.
  - Energy Efficiency Core KM0：Cortex-M23 with main frequency up to 20MHz.
  - SWD/JTAG simulation debugging interface.

- **Memory**
  - 512K bytes SRAM for KM4 core
  - 64K bytes SRAM for KM0 core
  - XIP flash memory from 4M bytes

- **Wi-Fi**
  - 802.11 a/b/g/n 1T1R 2.4/5GHz dual frequency.
  - Processing Wi-Fi messages using independent Microcontrollers.
  - Support low power TX/RX mode in short distance applications.
  - Support narrow-band mode: 10MHz bandwidth.
  - Support Antenna diversity.
  - Support the IEEE Power Save Model

- **BT 5.0 Low Energy**
  - Comply with Low Power Bluetooth 5.0 Standard.
  - Support high power mode (10dbm).
  - Wi-Fi and BLE time division multiplexing and share the same PA and antenna.
  - Support Bluetooth Master-Slave Mode and BLE mesh.
  - rates

- **Safety**
  - ARM Trust Zone-M Technology.
  - AES/DES/SHA Hardware Accelerator, Random Number Generator
  - Security boot Safe Start
  - Anti-reading mechanism: JTAG interface protection, flash encryption technology.

- **Peripherals**
  - 10 x GPIO
  - 1 x SPI、1 x I2C、
  - 3 x PWM, 2 x ADC
  - 3 x UART
  - Low power RTC

- **Interface and Dimension**
  - Maintain pin compatibility with similar package modules.
  - RF Interface: PCB antenna, IPEX connector antenna

- 18*33*3mm, stamp hole

- **Application Functions**
  - Support AliOS and MXOS operating system
  - Provide major cloud platforms access SDK
  - Mass production firmware for typical applications

- **Typical applications**
  - Smart home appliances
  - Smart electric equipment
  - Industrial automation

- **Ordering Code**

Ordering Code	Notes
EMC3290-DZJ6	PCB Antenna, Temperature: -20~85℃
EMC3290-SZJ6	IPEX Antenna, Temperature: -20~85℃
EMC3290-DZJ7	PCB Antenna, Temperature: -40~105℃
EMC3290-SZJ7	IPEX Antenna, Temperature: -40~105℃

Product Series   EMC   3   29   0   -D   Z   J   6   -xxx

EMC=Wi-Fi + BLE Module

Product Type
3=3.3V Standard Universal Voltage

Typical Target Applications and Functions
29= IoT Application 29 Series

Shape size, enhancement function
0=18mm x 33mm, 2 x 6pin 2.0 Spacing double row stamp hole + 9 pin 2.0
Spacing stamp hole

RF Interface
P=2.4/5GHz，On-board PCB antenna

E=2.4/5GHz，External antenna IPEX connector

PSRAM Capacity
Z= Without PSRAM
J=4M bytes PSRAM

Flash Capacity
I=2M bytes Flash Memory
J=4M bytes Flash Memory
M=32M bytes Flash Memory

Temperature Range
6= -20°C~85°C

Optional
TR= Tape wrap (pallet is used by default)

Optional Model

Order Code	Description
MXKIT-Base	Development board motherboard, suitable for all EMC3290 modules.
MXKIT-Core-C3290	Development board core board for EMC3290 includes the EMC3290-P module. Used with MXKIT-Base.
FX-3290	EMC3290 Production fixture, including accompanying plate: MXKIT-Base，MXKIT-Core-3290.

Version Update Record

Date	Version	Update Items
2023-03-15	0.5	Initial Document.
2023-06-10	0.6	Update Bluetooth RF parameters. Update label information. Update Pin Definition.
2023-06-21	0.7	Add Module photograph. Update working temperature parameter.
2023-06-25	0.8	Modify Pin Definition. Update Working mode table.
2023-06-25	0.9	Add remarks for PA30 pin.
2023-08-21	1.0	Add order code.
2024-03-20	1.1	Modify Pin name.

1. **Introduction**

EMC3290 is a high-performance module mainly used in applications of the Internet of Things. It has a dual-core microcontroller with ultra-high integration, supports 2.4/5GHz dual-band Wi-Fi and BLE 5.0 wireless communication technology, and includes large capacity Flash, RAM, meet various complex requirements in speech application.

The core of high performance is a 32-bit core with a main frequency up to 200 MHz. Based on the latest ARM v8-M architecture, it not only has low power consumption, but also can complete floating-point operation. The core frequency of high energy efficiency reaches 20MHz, which provides a simplified instruction system for ultra-low power applications, so that the system can keep standby for a long time.

2.4/5GHz dual-band Wi-Fi guarantees stable Internet connection at any time. BLE 5.0 technology can not only facilitate users to complete the rapid configuration of products, but also realize the intelligent networking of a large number of local devices through Mesh technology.

Shanghai MXCHIP provides MXOS software platform to support the development of EMC3290, providing an efficient development environment, rich sample programs and typical applications.

The following diagram is the hardware block diagram of EMC3290 module, which mainly includes:

- Dual-core wireless microcontroller
- Flash memory with optional capacity
- Plate-borne antenna or external antenna pedestal

Figure 1 EMC3290 Hardware Block Diagram
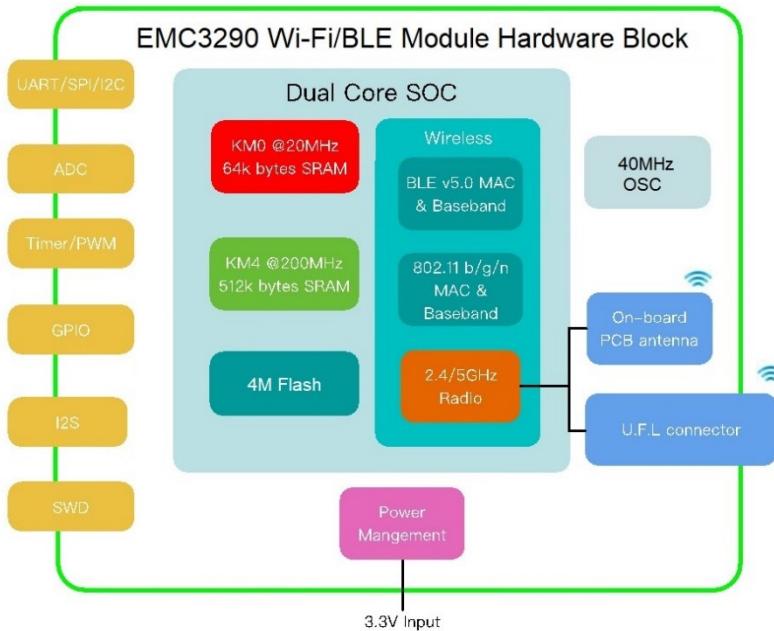

2. Pin Definition

2.1. Pin Distribution

Figure 2 Pin Arrangement
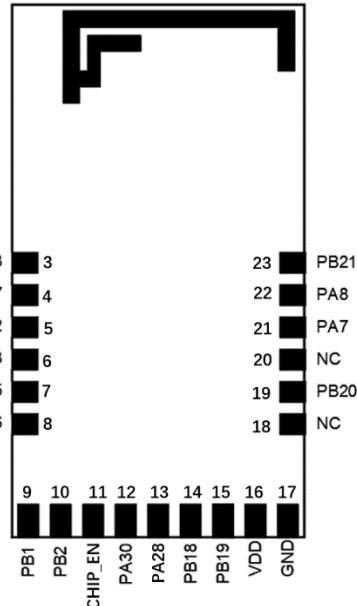

2.2. Pin Definition

Table 1 EMC3290 Pin Definition

Pin No.	Name	I/O	Recommended Function
3	PB3	I/O	SWD_CLK：SWD debugging
4	PA27	I/O	SWD_DIO：SWD debugging
5	PB22	I/O	ADC4
6	PB23	I/O	ADC5
7	PA25	I/O	I2C_SCL
8	PA26	I/O	I2C_SDA
9	PB1	I/O	UART_TXD, application serial port
10	PB2	I/O	UART_RXD, application serial port
11	CHIP_EN[3][5]	I/O	RESET
12	PA30	I/O	PWM7
13	PA28	I/O	PWM6
14	PB18	I/O	HS_UART0_RXD
15	PB19	I/O	HS_UART0_TXD
16	VDD	I/O	VDD
17	GND	I/O	GND
18	NC	I/O	-
19	PB20[1]	I/O	BOOT, refer to Table 2 for operating mode selection
20	NC	I/O	-
21	PA7	I/O	Debug_TXD，debugging/download serial port
22	PA8	I/O	Debug_RXD，debugging/download serial port
23	PB21	I/O	EASYLINK, refer to Table 2 for operating mode selection

Notes：

1. Module working mode selection signal. During the startup phase, the module detects the level of these pins and enters a specific working state. The correspondence between level and working mode is shown in Table 2:

Table 2 operation mode

| Operation mode		PA7 （Debug_TXD） Default: 1	PB20 （BOOT） Default: 1	PB21 （EASYLINK） Default: 1
ISP Program Mode		0	not detect	not detect
Test mode		1	not detect	not detect
Normal	QC	no detect	0	0
	ATE	no detect	0	1
	APP	no detect	1	not detect

(1) ISP Program Mode, Test mode and Normal mode are detected by hardware at startup. PA7, because it is a function of hardware solidification, it cannot be modified.

(2) QC, ATE and APP modes are judged by the firmware provided by MXCHIP, and the detection conditions and functions can be adjusted by modifying the firmware.

(3) ISP Program Mode function contempt: In the startup phase, if the processor hardware detects that the levels of PA1 are low(Using a pull-down 1K resistor is suggested), it enters ISP programming mode. In the ISP programming mode, the flash of the module can be programmed through Debug UART (PA7, PA8).

(4) Test mode is the reserved mode of the chip and will not be used.

(5) After the startup is completed, when the processor runs the firmware provided by MXCHIP, the firmware detects the status of PB20 and PB21 to enter the corresponding working mode. among them:

● QC mode is used to self-check the hardware during production and generate QC information for the production device to check the quality of the module.

● In the ATE mode, a series of serial commands are provided to make the radio frequency in a specific transceiver mode, so that the instrument can be tested and calibrated.

● APP is the normal working mode for running applications.

2. The Debug UART serial port is used for the input / output of debugging information. Do not use it during design and provide as easy a way as possible to facilitate software development.

3. PA30 and CHIP_EN pin are internal pull-up. The CHIP_EN pin is an enable reset pin, which is active low and can be left floating if not used.

4. Please keep the unused pins floating. It should be noted that the IO port is in a floating state at startup. If you need to configure the state of the pin through software, you need to wait until the code in the bootloader starts to execute. The time from when the module is powered on to when the code in the bootloader is executed will be affected by the flash startup time. Therefore, if you need IO to be in a certain level state at startup, you need to use a 100k resistor on the pin to pull up and down. Figure 3 shows the level change of the IO port whose software is configured as a low level after being pulled up by an external 100K resistor in the floating state. It can be seen that the time from the power-on of the module to the controllable IO port software is 69.4ms, and the time during which the IO is pulled to the high level is about 20ms.

Figure 3 IO The power-on state interface
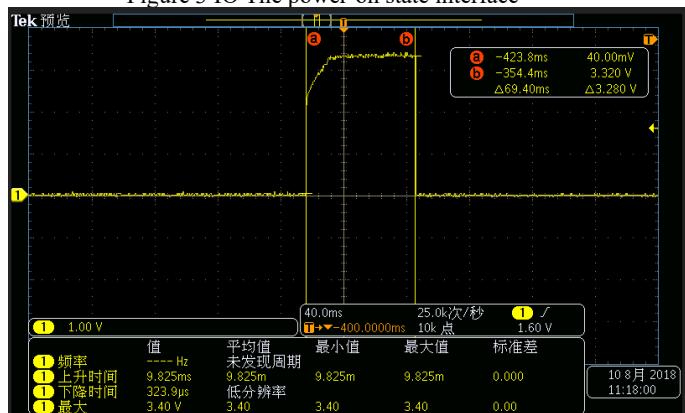

3. Electrical Parameters

3.1. Absolute Maximum Parameter

Modules operating outside the absolute maximum ratings may cause permanent damage. At the same time, long-term exposure to the maximum rating conditions will affect the reliability of the module.

Table 3 Absolute maximum parameter: voltage

Symbol	Ratings	Min	Max	Unit
VDD–VSS	Voltage	−0.3	3.6	V
VIN	Input voltage on any other pin	VSS−0.3	VDD+0.3	V

Table 4 operating parameter: voltage and current

Symbol	Note	Specification			
		Min.	Typical	Max.	Unit
V_{DD}	Voltage	3.0	3.3	3.6	V
I_{VDD}	3.3V Rating Current (with internal regulator and integrated CMOS PA)			450	mA

3.2. Digital IO DC characteristic

The electrical characteristics of the module's digital IO port are described in Table 12 under 3.3V power supply.

Table 5 Operation parameter

Symbol	Note	Conditions	Specification			
			Min.	Typical	Max.	Unit
V_{IH}	Input-High Voltage	LVTTL	2.0	-	-	V
V_{IL}	Input-Low Voltage	LVTTL	-	-	0.8	V
V_{OH}	Output-High Voltage	LVTTL	2.4	-	-	V
V_{OL}	Output-Low Voltage	LVTTL	-	-	0.4	V
I_{IL}	Input-Leakage Current	V_{IN} = 3.3V/0V	-10	±1	10	µA

3.3. Temperature

Table 6 Storage temperature and operation temperature

Symbol	Ratings	Min.	Max	Unit
T_{STG}	Storage temperature	−55	125	°C
T_A	Ambient Operating Temperature (Please refer to the order code for details)	-40	105	°C
T_J	Junction Temperature	0	125	°C

3.4. ESD

Table 7 Electrostatic discharge parameters

Symbol	Name	Name	Level	Max.	Unit
VESD(HBM)	Electrostatic discharge voltage (Human body model)	TA= +25 °C comply with JESD22-A114	2	2000

RX Characteristics					
Minimum Sensitivity PER ≤30.8%	LE_1M	-	-98	-97	dBm

4. Antenna Information

4.1. Antenna Type

EMC3290 has two specifications: PCB antenna and IPX connector. Please refer to order code.

Table 17 EMC3290 Onboard PCB antenna parameter (2.4GHz)

Item	Min.	Typical	Max.	Unit
Frequency	2400		2500	MHz
Impedance		50		Ω
VSWR			2	
Gain	-0.37dBi			
Efficiency	47%			

Table 18 EMC3290 Onboard PCB antenna parameter (5GHz)

Item	Min.	Typical	Max.	Unit
Frequency	5100		5800	MHz
Impedance		50		Ω
VSWR			2	
Gain	-0.69dBi			
Efficiency	42%			

4.2. PCB Antenna Clearance

When using PCB antenna in WIFI module, it is necessary to ensure that PCB and other metal devices are at least 16 mm away from the motherboard. The shaded areas in the figure below need to be far away from metal devices, sensors, interference sources and other materials that may cause signal interference.

Figure 4 PCB Antenna Minimum Clearance（unit: mm）
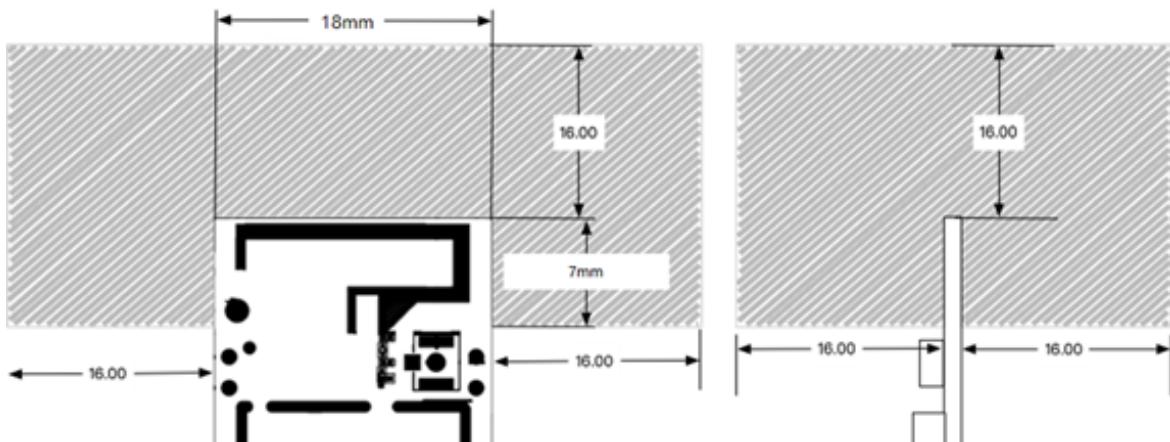

4.3. External Antenna Connector

Users can select 2.4G & 5G antennas with different external dimensions and gains of no more than 2dBi depending on the application environment. The following is a copper tube antenna for an IPEX connector commonly used by MXCHIP.

Figure 5 Eternal antenna size
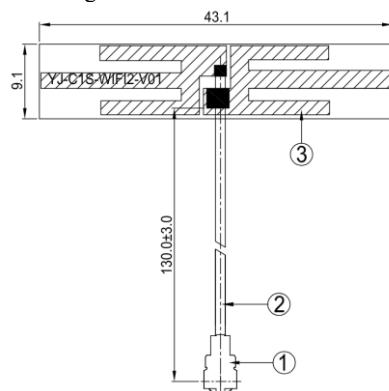

- Frequency Range: 2.4-2.5GHz 5.15-5.85GHz z
- Input independence: 50 Ohm
- SWR: < 2.0
- Gain：3.0dBi@2.4-2.5GHz 5.9dBi@5.15-5.85GHz
- Polarization: vertical
- Directionality: Omnidirectional
- Copper tube: 4.4*23mm: 4.4*23mm
- RL: < -10 dB
- Cable: O.D.1.13mm//L=130mm, Blue

Figure 6 Dimension Diagram of External Antenna Connector
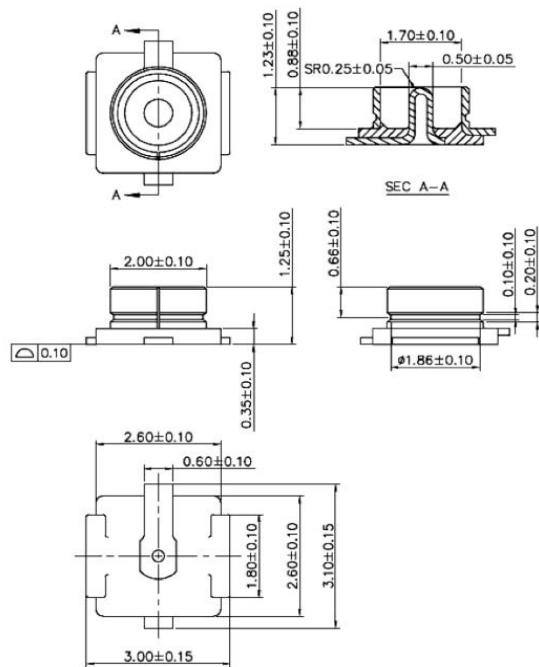

5. Dimensions and Production Guidance

5.1. Assembly Dimension Diagram

Figure 7 EMC3290 dimension（unit: mm）
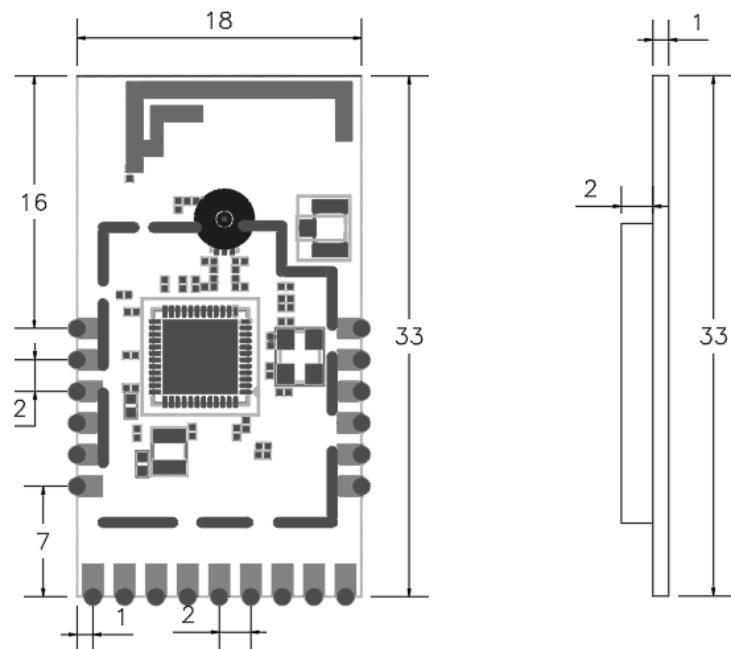

5.2. Packing dimension diagram

Figure 8 EMC3290 packing dimension（unit: mm）
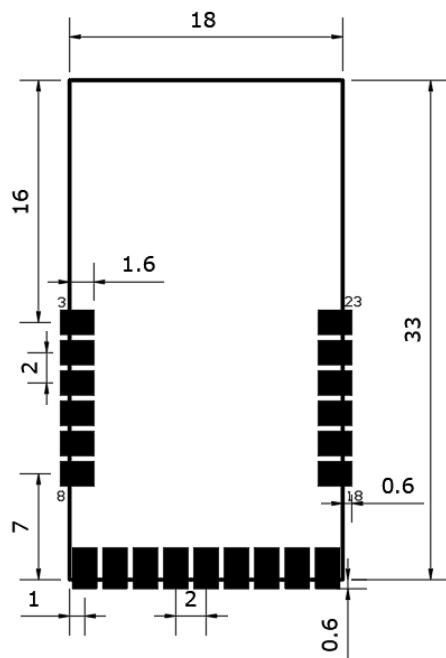

6.   Production Guidelines

MXCHIP stamp port packaging module must be SMT machine patches, module humidity sensitivity grade MSL3, after unpacking more than a fixed time patches to bake module.

- SMT patches require instruments
  - Reflow bonding machine
  - AOI detector
  - 6-8mm suction nozzle
- Baking requires equipment:
  - Cabinet oven
  - Anti-static, high temperature tray
  - Antistatic and heat resistant gloves

The storage conditions of MXCHIP module are as follows:

- Moisture-proof bags must be stored in an environment with temperature < 30 degree C and humidity < 85% RH.
- A humidity indicator card is installed in the sealed package.

Figure 9 Humidity Card

After the module is split, if the humidity card shows pink, it needs to be baked.

The baking parameters are as follows:

- The baking temperature is 120°C±5°C and the baking time is 4 hours.
- The alarm temperature is set to 130°C.
- SMT patches can be made after cooling < 36°C under natural conditions.
- Drying times: 1 time.
- If there is no welding after baking for more than 12 hours, please bake again.

If the disassembly time exceeds 3 months, SMT process is forbidden to weld this batch of modules, because PCB gold deposition process, over 3 months, pad oxidation is serious, SMT patch is likely to lead to virtual welding, leak welding, resulting in various problems, our company does not assume the corresponding responsibility;

Before SMT patch, ESD (Electrostatic Discharge, Electrostatic Release) protection should be applied to the module.

SMT patches should be made according to the reflow curve. The peak temperature is 250 C. The reflow temperature curve is shown in Chapter 9, Figure 11.

In order to ensure the qualified rate of reflow soldering, 10% of the first patches should be taken for visual inspection and AOI testing to ensure the rationality of furnace temperature control, device adsorption mode and placement mode, and 5-10 patches per hour are recommended for visual inspection and AOI testing in subsequent batch production.

6.1. Precautions

- Operators of each station must wear static gloves during the entire production process;

- Do not exceed the baking time when baking;

- It is strictly forbidden to add explosive, flammable or corrosive substances during baking;

- When baking, the module uses a high temperature tray to be placed in the oven to keep the air circulation between each module while avoiding direct contact between the module and the inner wall of the oven;

- When baking, please close the oven door to ensure that the oven is closed to prevent temperature leakage and affect the baking effect.

- Try not to open the door when the oven is running. If it must be opened, try to shorten the time for opening the door;

- After baking, the module should be naturally cooled to <36°C before wearing the static gloves to avoid burns;

- When operating, strictly guard against water or dirt on the bottom of the module;

The temperature and humidity control level of MXCHIP factory module is Level3, and the storage and baking conditions are based on IPC/JEDEC J-STD-020.

6.2. Storage Condition

Figure 10 Storage Conditions Diagram

6.3. Secondary Reflux Temperature Curve

We recommend solder paste model: SAC305, lead-free. No more than 2 reflux times.
